January 1998

Unpublished report of Study# BI-2207 to Fundy National Park, Dept. of Canadian Heritage,
Alma, New Brunswick, in partial fulfillment of the "Status of Moths of Fundy National Park and
its Greater Ecosystem."

CHECK LIST OF THE MACROMOTHS OF FUNDY NATIONAL PARK AND THE GREATER FUNDY ECOSYSTEM, NEW BRUNSWICK

Introduction

Apart from short lists of New Brunswick moths published late in the last century and earlier this century (Mackenzie 1899; McIntosh 1899, 1901, 1904; Gorham 1945) there are few other lists of New Brunswick moths. Wood (1951) included 31 species of macromoths in his list of lepidoptera larvae collected in commercial blueberry fields in Charlotte Co., and Thomas (1996) listed 311 species, in 15 families of mostly macromoths, taken between 21 June-30 July, 1990 in Sunbury Co. Species whose larvae feed on forest trees were documented by McGugan (1958) and Prentice (1962, 1963). These three publications list all the species recorded by the Forest Insect Survey and include statements on their distribution across Canada. As such, it is not easy to obtain a list of species recorded from New Brunswick. The Forest Insect and Disease Survey published a list of insect pest species in the Maritime Provinces (Titus et al 1985). This is an alphabetical listing of species in all orders and, as such, it is extremely difficult to get a listing of the Lepidoptera. Also, the provinces where each species occurs is not recorded. Recently, the moth fauna of Fundy National Park has become well known. Edsall and Clay (1994) listed all the species collected during a full-year sample (1993) at two sites there, in Albert Co. and Kings Co.; a total of 311 species. Thomas et al. (1996) gave the flight seasons of 401 species of moths taken at the Wolfe Lake site in Fundy National Park in 1994. At the end of 1996, the species richness at the Wolfe Lake site was up to 522 (Thomas and Clay 1997a, 1997b). Up until now, this Wolfe Lake data set represented the most complete listing of moth species for any single locality in the Maritime Provinces. Perhaps the best estimate of all the species expected to be present in New Brunswick can be obtained from Ferguson's (1954) publication on the Lepidoptera of Nova Scotia, where he documented the occurrence of 789 species in that province.

Data

This manuscript lists all the species of macromoths, in 15 selected families, collected during a 4-year period, 1994-1997, in Fundy National Park and adjacent forests that form part of the Greater Fundy Ecosystem. Collections from 29 light traps over the 4-year period produced about 180,000 individuals of which over 130,000 have been identified. Thus far, 602 species in the 15 selected families have been identified (Table 1) which together with 17 other species listed by Edsall and Clay (1994) (also included in Table 1 and identified by **) that were not collected during the study period, bring the species total to 619. These species are listed in the check list in a sequence that follows Hodges' (1983) Check List and uses the same catalogue numbers. Since 1983, there have been some changes in nomenclature. These are scattered throughout the literature but many are in Poole (1996). I have incorporated all the changes that I am aware of. Also included in the check list are the extreme dates of captured, summarized for all collection sites and all years, to give an idea of the seasonal flight activity for each species. A coloured photograph of at least one species from each Family or Subfamily is featured in Plates I, II, and III. The illustrated species are bolded in the check list.

Acknowledgements

I am deeply indebted to Dr. Doug Clay, Fundy National Park, who made this study possible and supported it in many ways including financial and logistical. Ed Kettela, CFS-Atlantic, provided logistic and financial support, via the Fundy Model Forest program, for which I am grateful. I thank Shirley Butland, Fundy National Park, and Heather Clay for field assistance in the emptying of traps and initial sorting of specimens.
